Related Collections.Q: Transition from Full PHP to Hybrid Frameworks I have been working with full PHP for the past five years, and my newest application is nearly complete. I love this framework, it runs great and it's flexible enough for a web application like this. I'm thinking of migrating to a hybrid framework, like Codeigniter or Zend or another one. I like the idea of having a PHP framework and my own

business logic, but it is very likely that I will need to write a lot of PHP code, for example, writing my own serialization. I will still have two.NET developers helping me on this project. Should I do this? Should I still use PHP to do the business logic? I'm just wondering what to consider while doing this. Thanks. A: PHP is not "magical" in terms of performance. If it's the bottleneck you need to worry about, you'll have to make sure you've got it optimized to death. Just using a different framework won't help unless you've got it running very fast in your

stack. Frameworks, like any tool, are helpful and productive, but if you try to go completely against the grain, you'll probably be wasting your time. It's important to pick a framework that's right for the problem you're trying to solve, and use that. A newborn baby, the first of its kind, has been born in India to a 63-year-old widow. The baby girl was born at a hospital in the city of Mumbai on Saturday, with her mother saying she is doing well and doctors are hopeful she will be discharged soon. The birth comes as India grapples with a rise in the

number of deaths among infants in the country, with a reported 2,000 babies dying last year. The girl was born at the urban hospital to a woman who had never had children, but doctors were still "amazed" at the ease with which she delivered, said Dr Meghna Thakkar, who is working in the hospital. "This is the first birth of a first baby in her life. There were no issues with her pregnancy or delivery," Dr Thakkar said. India has one of the highest rates of newborn deaths in the world. A huge challenge is that India has a very high
