With the main window up, all you need to do is decide what files you want to encrypt. The neat thing is you can select more files, and even though drag and drop is not supported, the built-in browse dialog allows multiple selection, and isn't that difficult to use. All loaded items are stored in a list, identifying them by their paths. Multiple algorithms, and related options There are several algorithms you can choose from before putting the process in motion, such as AES, Blowfish, Serpent, or Twofish. In addition, you can access the settings tab for a few more related options. Just so you don't leave anything behind, the application can be set to automatically remove source files while encrypting, as well as permanently removing traces from the temp folder. A slider gives you the possibility to set compression ration, which can help you save a bit of disk space. In case you're planning to take encrypted files with you, there's the possibility to have encrypted files bundled into a self-extracting program, but not without asking for the password you need to set. On an ending note To conclude, OhCrypt manages to live up to expectations, coming as a portable, practical solution on which you can rely for that extra bit of security. The whole process is intuitive enough to make accommodation a walk in the park even for inexperienced individuals, while different algorithms provide more security options.
