dbForge is an advanced Open Source database development tool set that allows you to build powerful data driven applications for the Microsoft platform. dbForge implements a fully featured, rapid application development platform that makes it easy to develop complex solutions, while providing the maximum amount of flexibility for creating and deploying applications that run in Windows. dbForge is easy to learn and use, and comes with a large library of well known, industry standard data access technologies, including ODBC, JDBC, and ADO.NET, making it the perfect choice for a wide range of commercial and open source applications. DocMiner for PostgreSQL is a powerful tool for generating static HTML document websites from the PostgreSQL database. DocMiner allows users to extract all the data from the database tables and use it to build dynamic HTML website. DocMiner for PostgreSQL uses a simple user interface to provide you an easy and convenient way to view your data. It can also generate PDF files from your data, and display the data in table, list or map format. DocMiner for PostgreSQL Description: The application supports several available output formats such as: Excel, HTML, PDF, Word, and Microsoft PowerPoint, as well as conversion to database files such as CSV, HTML, Oracle, Microsoft SQL Server, Microsoft Access, Microsoft Excel, and more. In addition, users can perform regular expressions for fields or the whole document. And the document structure can be easily customized, allowing the output of even complex structure. TabularCompare for PostgreSQL is a powerful table comparator and data migration utility. It supports comparing and synchronizing any kind of tabular data between PostgreSQL and Microsoft SQL Server databases, as well as to other native tabular data sources. TabularCompare for PostgreSQL allows user to access data stored in PostgreSQL databases using either OLEDB or ADO.NET clients and to synchronize them with Microsoft SQL Server databases using ADO.NET. The app's main functions include database schema comparison and database synchronization, to allow for direct comparisons and upgrades between PostgreSQL and Microsoft SQL Server database tables. In addition to supporting table migrations, the application is capable of performing row level comparisons as well as common data extraction from the source and target databases. Moreover, it supports various file formats such as CSV, Excel, SQL Server, Oracle and XML, and has a wide range of database field comparison functions, which allow for determining the differences between columns and between entire tables. A utility designed to make the conversion of MD5 encrypted passwords more user-friendly, while ensuring the integrity of the passwords during the conversion process. The app is also able to take passwords from an unencrypted user database (SQL Server, MySQL) and convert them to MD5 encrypted passwords. By enabling the user to connect to a SQL database, the

application is able to obtain the user names and passwords of the user database. The app uses the wincrypt.dll library to obtain the encrypted password, and then compares it to the encrypted password of the user specified. In the event that they are found to be the same, the password will be converted to the same MD5 password. If the encrypted passwords are different, however, a "Do not convert" message will appear. Some other features of this app include: - Configuration setup: The user is able to specify which encryption functions to use, and also the location of the encrypted password file. - Password policy: The user is also able to configure a password policy that will be enforced during the conversion process. Keymacro is the only app out there that can detect the presence of potentially vulnerable (weak) SQL passwords used to log on to SQL databases. Although it's a useful tool for web administrators and database managers, the app can also be used by regular users to check whether or not their passwords are safe. Although it will likely not replace the need for proper password policies and procedures to be followed, in combination with other tools, Keymacro will allow the user to ensure that all passwords used to log on to SQL databases are sufficiently strong, in order to ensure that the databases are safe from potential security threats. KEYMACRO Description: FTP Streaming is the most efficient way to backup and restore data for any of the applications that allow FTP connections. It is a solution that will allow you to provide your users with the ability to backup and restore applications (e.g. files, images, databases, etc.) over FTP and SFTP. FTP Streaming is a solution that will allow you to provide your users with the ability to backup and restore applications (e.g. files, images, databases, etc.) over FTP and SFTP. With just a few clicks, you will be able to ensure that you are protecting your users' valuable data. dbForge Schema Compare for PostgreSQL is a graphical schema comparison and database deployment tool that was developed specifically for those who seek to identify and compare the changes that might occur in tabular data, between PostgreSQL databases and Amazon Redshift cloud environments. Not only does the app allow one to perform such comparisons, but deploying Redshift schemas is also supported, enabling users to automate the process. Furthermore, using the app, one will be able to generate SQL synchronization scripts which can be used for keeping the database schemas up to date automatically. In terms of updating the schema and tabular structure, users will also be able to apply updates straight from the databases that are found in development stages, directly to the production workflow. Besides the migration of the PostgreSQL database schemas to Amazon Redshift cloud environments, the application also enables one to fix the errors and assign characteristics to a synchronization routine, which will then be carried out automatically. dbForge SQL Server Agent is a smart scheduler that makes task scheduling and performance optimization easy. It features built-in scheduling, graph interface and intuitive graphical report builder, as well as compatibility with Windows and Linux OS. dbForge SQL Server Agent allows one to connect databases and define jobs, schedules them and displays reports for detailed performance analysis. Job processing options include standard and advanced ones, while the scheduling options include a week, a month or a year. The scheduling template feature also allows one to set up complex schedules with conditions and recurrence rules. Besides these options, the application also allows one to set up jobs as reminders. dbForge SQL Server Agent is available in two editions: a free edition and a paid edition. The free edition supports one SQL Server instance, while the paid edition supports multiple instances. In addition, the free edition has its limitations, as it offers limited functionality in comparison to the paid version. Besides the free edition, the paid edition is also available in a single-user and a multi-user versions. Single-user features include notepad integration, the ability to work with SQL scripts and use the SQL Server Management Studio. The multi-user version allows one to manage multiple SQL instances, manage a job history, and back up databases and SQL Server Agent configurations. Furthermore, the application allows one to export and import schedule configurations, as well as export reports. Key Features: Schedule any job when it is executed, such as tasks or recurring events Set up reminders to remind about the job execution Specify how the job is going to be executed Def
